Linear

Parametrization

This model is just a simplified way of spesifying a "fixed" effect

$$\eta_i = \beta w_i$$

where β is Normal with mean μ and precision τ (which are typically unequal to the default values; see `?control.fixed`).

Hyperparameters

None

Specification

```
f(w, model="linear", mean.linear = <mu>, prec.linear = <prec>)
```

where `<mu>`*isthepriormeanand*`<prec>` is the prior precision.

Hyperparameter spesification and default values

set.default.values FALSE

pdf linear

Example

```
n = 100
w = runif(n)
y = 1 + w + rnorm(n)
r = inla(y ~ f(w, model = "linear",
               mean.linear=1, prec.linear=1),
         data = data.frame(y,w))
summary(r)
```
