

## Continuous random walk model of order 2 (CRW2)

### Parametrization

The continuous random walk model of order 2 (CRW2) for the Gaussian vector  $\mathbf{x} = (x_1, \dots, x_n)$  is described in the GMRF-book chapter 3. It is an exact representation of the continuous CRW2 model augmented with its derivatives. The use is the same as for RW2.

### Hyperparameters

The precision parameter  $\tau$  is represented as

$$\theta = \log \tau$$

and the prior is defined on  $\theta$ . Note that  $\tau$  is the precision for the first order increments.

### Specification

The CRW2 model is specified inside the `f()` function as

```
f(<whatever>, model="crw2", values=<values>, hyper = <hyper>)
```

The (optional) argument `values` is a numeric or factor vector giving the values assumed by the covariate for which we want the effect to be estimated. See next example for an application.

### Hyperparameter specification and default values

`hyper`

`theta`

```
name precision
short.name prec
initial 4
fixed FALSE
prior loggamma
param c(1, 1e-04)
```

`constr` TRUE

`nrow.ncol` FALSE

`augmented` FALSE

`aug.factor` 2

`aug.constr` 1

`n.div.by` NULL

`n.required` FALSE

`set.default.values` FALSE

## Example

```
n=100
z=seq(0,6,length.out=n)
y=sin(z)+rnorm(n,mean=0,sd=0.5)
data=data.frame(y=y,z=z)

formula=y~f(z,model="crw2")
result=inla(formula,data=data,family="gaussian")
```

## Notes

The CRW2 model is intrinsic with rank deficiency of 2.

The model RW2 is an good (enough) approximation to CRW2 and do not augment with the derivatives.
