

Student- t with strata

Parametrization

This model is an extension to the Student- t , where different strata have their own precisions but the degrees-of-freedom parameter is common.

The Student- t likelihood is defined so that

$$\sqrt{w \tau_s}(y - \eta) \sim T_\nu$$

for continuous response y where

τ_s : is the precision parameter, depending on the stratum s

w : is a fixed weight $w > 0$

η : is the linear predictor

T_ν : is a standardized Student- t with ν degrees of freedom such that its variance is 1 for any value of ν , common for all strata.

Identity

Hyperparameters

This likelihood $N_s + 1$ hyperparameters

$$\begin{aligned}\theta_1 &= \log(\nu - 2) \\ \theta_2 &= \log(\tau_1) \\ \theta_3 &= \log(\tau_2) \\ &\text{etc....} \\ \theta_{N_s+1} &= \log(\tau_{N_s})\end{aligned}$$

where N_s is the number of strata defined. The current implementation limits N_s to 10, but this is easy to fix if needed. The prior is defined on $\theta = (\theta_1, \theta_2, \dots)$.

Specification

- family = **tstrata**
- Required argument: y and w (keyword **weights**, default to 1), and **inla()**-argument “**strata**” which is either a integer vector with elements $1, 2, \dots, N_s$, or factor for which the levels defines the strata.
