Gaussian model for Stochastic volatility

Parametrization

The Gaussian likelihood for stochastic volatility models is defined as:

$$\pi(y|\eta) = \sigma\epsilon$$

where

$$\epsilon \sim \mathcal{N}(0,1)$$

Link-function

The scale parameter σ is linked to the linear predictor η as:

$$\sigma = \exp(\eta/2)$$

Hyperparameters

None

Specification

- family = stochvol
- Required argument: y.

Example

In the following example we specify the likelihood for the stochastic volatility model to be Gaussian
